A new "mirroring enabled" field should be added to the RBD image header. Mirroring should not rely on a feature bit.

* `rbd mirror image enable <image-spec>`
  This is an alias for `rbd feature enable mirroring`

* `rbd mirror image disable <image-spec>`
  This is an alias for `rbd feature disable mirroring`

* `rbd mirror image resync <image-spec>`
  This will delete the local image and initiate a full resync with a remote primary image. This can be used to fix an inconsistent secondary image.

Also add journal details/mirroring status support to `rbd info` and `rbd status`
