Description

Per:
http://docs.openstack.org/api/openstack-object-storage/1.0/content/object_storage_api_overview.html

"Your service provider creates your account and you own all resources in that account. The account defines a namespace for containers. A container might have the same name in two different accounts."

The current implementation of RGW is that of a global container namespace instead of having one namespace per account. There are users with thousands of tenants in a single OpenStack environment which will inevitibly lead to container name collisions with our current method.
