| Description | |
| Right now if you try to mount ceph-fuse and there's no MDS in the system, it simply hangs. This is confusing for new users as they have no idea what's going on. We should probably report on the command line and in the logs when a user is trying to mount CephFS with no MDS present. | |

ceph-fuse: warn and shut down when there is no MDS present

This patch checks the up MDS servers when mounting. If there's no MDS server up, report in the log then force quit.

Fixes: #12204
