Description			
Right now, about all the information you can pull out is that the MDS is in standby/replay/rejoin/whatever state. We should expose (to admin users) the "progress" through each of those states, as best we can find. That will include stuff like the number of clients we've spoken to (against those we're waiting on), number of inodes/dentries we've loaded out of the total demanded by clients, and anything else that might be noticeable.
