Description			
<p>Create a teuthology task that can be run in the background of a workunit, which simply starts a forward scrub on the root of the filesystem, waits for it to complete, and then does that again and again until the child tasks are complete.</p> <p>On normal workunits, there should never be any metadata damage, so any errors raised by the scrub will probably be bugs in the scrubbing code.</p> <p>Depend on http://tracker.ceph.com/issues/17852 to have a sensible way to wait for a scrub to complete before starting the next one.</p>
