Shuffling old notes here:

see if "osd journal" was overridden in `$cluster.conf`; if yes, do not attempt discovery

see if `$osd_data/journal` exists (do not follow symlink); if yes, use as journal (if dangling link, abort)

see if we can find matching block device (or file in known subdirs) by comparing uuids

ceph-disk-prepare now has external journal support, much of this doesn't have to live in the cookbook.

If admin wants to use a single SSD for multiple journals, then something still needs to create the GPT partition table on that disk -- **just once**, or it will lose data.
