Description			
The search field has a strange behaviour, it does not hide rows when you enter characters that aren't used in the text of the marked columns. search.gif

The characters that are entered are included in the columns, that's why the rows aren't hiding. A solution would be only to search the columns if ':' is included in the search pattern.

What exactly do you mean by "included in the columns"? The column names (the "table headers")? This would be irritating. I'd assume that entering search term without specifying a column would show only the matching data rows.

The problem is that if you type a character like 'a' or 'm' that is not included in the current selected column (here the text 'hot') NOR anywhere else in the complete data of the displayed row the row is not hidden. All available columns of the table are shown. If you type 'p' the row is hidden as expected because this character is not available in 'Name' nor any other column.
