Description

Admin APIs (like rgw_rest_bucket/metadata/user.*) that write metadata must be executed first on the metadata master zone. See the S3 APIs like RGWSetBucketVersioning::execute() for an example:

```c
if (!store->svc.zone->is_meta_master()) {
    op_ret = forward_request_to_master(s, NULL, store, in_data, nullptr);
}
```
