Description

Though the migration process runs through successfully, the displayed output is probably confusing:

```
Pulling container image registry.suse.com/caasp/v4.5/prometheus-alertmanager:0.16.2...
Non-zero exit code 1 from /usr/bin/podman run --rm --ipc=host --net=host --entrypoint stat -e CONTAINER_IMAGE=registry.suse.com/caasp/v4.5/prometheus-alertmanager:0.16.2 -e NODE_NAME=master registry.suse.com/caasp/v4.5/prometheus-alertmanager:0.16.2 -c %u %g /etc/alertmanager
stat:stderr stat: cannot stat '/etc/alertmanager': No such file or directory
Non-zero exit code 1 from /usr/bin/podman run --rm --ipc=host --net=host --entrypoint stat -e CONTAINER_IMAGE=registry.suse.com/caasp/v4.5/prometheus-alertmanager:0.16.2 -e NODE_NAME=master registry.suse.com/caasp/v4.5/prometheus-alertmanager:0.16.2 -c %u %g /etc/alertmanager
stat:stderr stat: cannot stat '/etc/alertmanager': No such file or directory
```

This is due to cephadm checking for two paths for the configuration file of the alertmanager because containers might have different places for them (like the SUSE container differs from the upstream prometheus alertmanager container).

The prometheus upstream container is not affected by this as the first try to determine the directory succeeds.
