Description	
If you run	
<pre>cephadm bootstrap --docker</pre>	
we're going to use docker for the bootstrap host. But we're not storing this persistently . Thus we're actually using podman on all other hosts .	
To fix this, we I see two options:	
<ol style="list-style-type: none">1. persistently store the docker flag as a module option2. drop --docker from cephadm bootstrap	
both options are IMO valid.
