Description

Description of problem

Currently, we're only ignoring the chart-container CSS selector, which is insufficient as we have other dynamic content on the dashboard component as well.
A lot of PRs like this have reported false positives due to changing text on the landing page or the 6px top padding on the charts.

I propose we use a different CSS selector, probably of parent class like `card-text`, which covers all the dynamic regions to mitigate these false positives.
